

Your Tax Dollars at Work: against Logic, Science, and God

Promoting manmade Religion in the Classroom and calling it “Science”

America was founded by people who believed that Freedom is important. For example, although all 55 of the Founders who signed our Declaration of Independence believed in God, and 52 were Christians, yet they refused to **FORCE** their views upon the public, but rather wanted people to be Free to make up their own mind. So in the First Amendment to our Constitution they spelled out what our federal government could and couldn't do: such as, Congress *shall make no law respecting an establishment of religion, nor to prohibit the free exercise thereof*. Thus in matters of faith, *the federal government is to remain neutral*.

However, this has not been the case for the past 50 years. For during that time “scientists” have not only *clung with fervency to their opinions of what they think*, but have elevated themselves to priestly figures who think they should be supported with Our Tax Dollars to propagate *their beliefs*, and teach **ONLY their beliefs** as if they were facts of “science,” while labeling all other views as “religion.”

In addition to government assistance in the classroom and our courts, the media has also sided with the science priests and provided them with lots of publicity: by which they tell the public how we should think and believe as well: only to discover that what is portrayed as “fact” is said to have occurred hundreds of millions of years ago where no one could document what occurred, has not been verified in laboratories, nor observed in nature. In other words, what they believe is *based on nothing more than (faith in) the power of nature to do what they can't*: i.e. make a living organism that can replicate itself. **And even IF they ever do succeed in creating life, you can be certain that a LOT of thought and Programming of DNA will be required: something that Nature alone could not achieve: even in Trillions & Trillions of years.**

Perhaps this is because they haven't stopped to look at the actual facts, nor to notice the growing number of critics, or perhaps because of an aversion to the thought of what belief in God entails? ¹ For conspicuously absent from almost all of the thousands of TV programs, textbooks and science journals is an admission that *what the science priests believe is based on nothing more than faith*, as opposed to what can be observed, demonstrated, or proven. They also simply ignore or downplay what is becoming more and more obvious: i.e. that logic, science, and the astronomical odds against life arising by itself point directly toward an intelligent Creator. This is because, as far as we know, **information ONLY comes from intelligence**, and because living things are full of information that is stored in their DNA.

In fact, as far as we know, **nature can't even create the most basic life-based protein** (only 8-amino acids long), **much less thousands of them that work together**. And now that the inner workings of the cell are known, it is becoming obvious that the genetic code or language of life could not have happened by accident. This is why the theory of Directed Panspermia,² -- that life came from outer space -- was invented: i.e. to shift the mystery of where life came from to another galaxy far off in space where nobody could prove what took place, much less observe, demonstrate, or repeat.

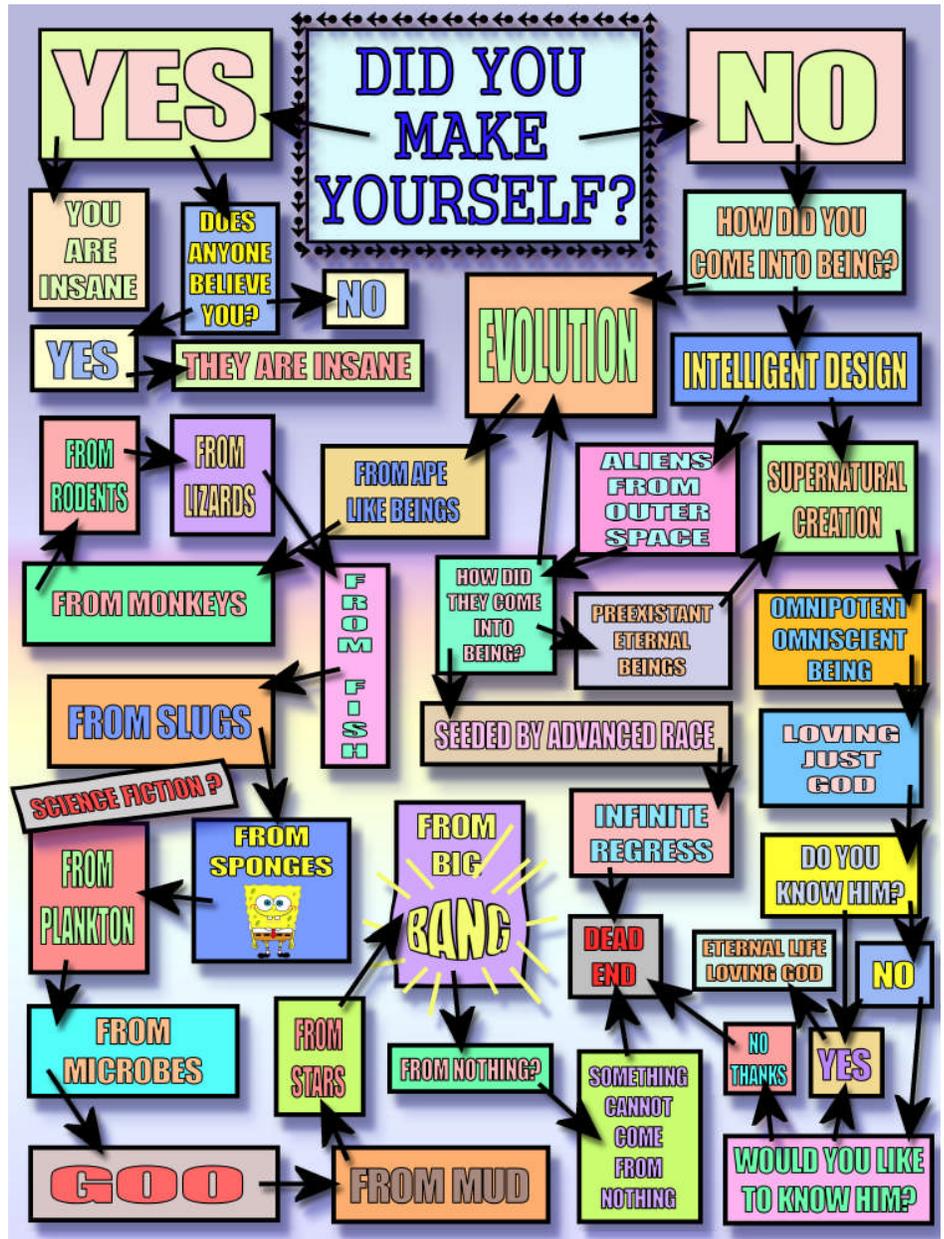

What are the Facts?

Scientists can't even make the 20 amino acids that living organisms use to make proteins, much less figure out how matter, time, chance and undirected energy could Create DNA, and then add an Encyclopedia of new and necessary information to it.³ And according to a recent article in *Scientific American* on how Life might possibly have originated (by itself),⁴ it was reported that scientists were able to mix two amino acids together and come up with ... *2-aminooxizole*. This is like finding a piece of iron ore stuck to a piece of magnetite. Cool perhaps, but nowhere close to the complexity of a computer, with monitor, printer, correct cables, power cord, AC voltage and running on Windows XP, nor anything remotely close to the complexity of a bacterium: the most simple of which has 40,000 (left-handed amino acid only) *proteins, of 600 different types, DNA, RNA, ribosomes, and a membrane: and that is dependent upon a more complex host organism to survive.*⁵ **And contrary to propaganda, water doesn't solve the problem, but rather complicates it.**⁶

The *information* in DNA is the heart of all living organisms: if not a *Divine Fingerprint* that points to our origin. That's because information doesn't occur by chance, nor can it be explained by random chemical reactions, nor undirected / destructive heat or electric sparks. In fact, our DNA and its associated machinery that reads, copies, and transfers information within our cells is more complicated than anything man has ever made: and without which (stored DNA info), life as we know it would not exist. For example, the proteins in our bodies decay at about a million a minute, yet we remain alive because our DNA – along with its machinery -- creates a million new ones per minute to replace those that just decayed.⁷

And since government didn't make us, we are left with God or the aliens. One offers Eternal life, the other entertainment: one is costly, while the other costs nothing. Both are voluntary. Thus it is time for scientists, ignorant, dishonest, or arrogant judges, and the media to stop touting **their religion** in the name of science and admit that they

don't know how we got here, nor how life arose, and that **evolution theories are not based on a science that can be observed or demonstrated, but on speculation, imagination, and faith in nature's ability to create rather than what we actually observe that it does: i.e. break things down and destroy them.**
